

Course Title	Introduction to Information and Communication Networks	Instructor(s)	Baiko Sai
		E-mail	bsai@miu.ac.jp
Class Style	Lecture, seminar, etc.	Office Hours	Thursday PM
Track		Mode of Instruction	Of-line
Credits	2	Allocated Year	Third or fourth year
Active Learning	Category4:Outward-Extemporaneous 9.Group Work on Questions, etc.	Compulsory or Elective	Elective
Course Overview	Acquire basic knowledge of information and communications network engineering and understand media handling theory, modulation methods, and the mechanisms of noise generation. Then, understand the configuration of familiar mobile communications networks. 1. Understand the overall configuration of telecommunications systems. 2. Understand various modulation methods. 3. Understand various transmission media. 4. Understand signals and noise. 5. Synchronization, a journey into mobile communications networks.		
Course Objectives	Through lectures and exercises, this course will explain how to convert information into electrical signals and transmit them efficiently over wired or wireless transmission paths. It will also explain the outline of analog communication systems and the characteristics of transmission paths, as well as the methods and characteristics of carrier modulation. It will also teach digital communication methods.		
Prerequisite			
Course Schedule	No	Contents	Homework
	1	Part 1: Introduction #1: Explanation of how the class will proceed. Introduction to the history of information and communication. Understand the difference between information as an intangible concept and signals as a physical entity. Understand the essential meaning of "communicating."	Assign homework to review and check comprehension
	2	Part 2: Information and communication network configuration #2: Types of information, coding of audio and video signals and bandwidth compression technology, data coding, and introduction to network configuration. Exercises.	Assign homework to review and check comprehension
	3	Part 3: Information handled through telecommunications #3: Amount of information, concept of entropy. Concept of redundancy. Exercises.	Assign homework to review and check comprehension
	4	Part 4: Basics of Electrical Signal Handling #4: Representation of signal waves in the time domain and frequency domain, Fourier transform and inverse Fourier transform, digital signal	Assign homework to review and check comprehension

		processing technology, digital television systems. Exercises.	
	5	Part 5: Analog Modulation #5: Principles of AM modulation. Circuits and characteristics of AM modulation. Necessity of modulation, amplitude modulation, DSB, SSB, modulation circuits, frequency spectrum, practice problems.	Assign homework to review and check comprehension
	6	Part 6: From Pulse Modulation to Digital Modulation #6: Principles of pulse modulation. Introduction to the digital modulation method of PCM modulation. Exercises.	Assign homework to review and check comprehension
	7	Part 7: Quantization of signals, sampling theorem #7: Quantization error, sampling theorem, theory of coding methods. Digital modulation of carrier wave, modulation rate and transmission rate. Exercises.	Assign homework to review and check comprehension
	8	Part 8: Summary of contents 1 to 7 #8: Quiz ① of contents 1 to 7, discussion.	Assign homework to review and check comprehension
	9	Part 9: Digital Modulation (1) #9: Multi-level modulation methods. Sampling theory, Pulse Code Modulation (PCM), predictive coding, digital modulation of carrier waves, modulation rate and transmission rate. Exercises.	Assign homework to review and check comprehension
	10	Part 10: Digital Modulation (2) #10: Signal multiplexing methods. Frequency division multiplexing (FDM), time division multiplexing (TDM), code division multiplexing (CDM), orthogonal frequency division multiplexing (OFDM), data signal multiplexing, packet multiplexing practice questions.	Assign homework to review and check comprehension
	11	Part 11: Digital Modulation (3) #11: Various disturbances in communications and noise reduction techniques. Internal noise, external noise, noise figure and equivalent noise temperature, disturbances due to distortion. Synchronization of digital communication systems, a journey to mobile networks. Exercises.	Assign homework to review and check comprehension
	12	Part 12: Telephone network, ISDN network #12: Understand the entire telephone network from telephone lines, dialed numbers, and exchanges (stations). Configure SDN networks. Understand assets to be left in historical museums. Exercises.	Assign homework to review and check comprehension
	13	Part 13: How the Internet Works #13: Network configuration elements and conditions. Introduction to wireless communications. Exercises.	Assign homework to review and check comprehension
	14	Part 14: Mobile network technology, satellite communication systems #14: Elements and conditions of network configuration. Introduction to wireless	Assign homework to review and check comprehension

		communications. Configuration, advantages, methods and application examples of satellite communication systems. Exercises.	
	15	Part 15: Summary #15: Summary of contents from 8 to 14. Free discussion of information and communication networks. Active running.	Assign homework to review and check comprehension
Grading	Quiz 20 % Assignments 30 % Attendance rate 50% Perform a comprehensive evaluation.		
Textbooks	No
